

B O L U O K E ® :

ANTIBACTERIAL ENHANCER

Dealing with patients fighting chronic infections?
This maybe the extra punch you need.

Bacterial biofilm (BBF) is a mucoid matrix-enclosed bacterial colonies adhering to each other and to a surface. BBF can protect the bacteria inside it from the effects of anti-bacterials and immune response, and can contribute to chronic infections.

Biofilms are responsible for diseases such as otitis media, recurrent UTIs in women, prostatitis in men and may be responsible for a wild variety of nosocomial infections. Research has shown that combining Lumbrokinase with Fleroxacin can significantly enhance the antibacterial effect against *Pseudomonas aeruginosa* in vitro¹.

Other known effects of Boluoke® (lumbrokinase):

- * Activates plasminogen
- * Degrades fibrinogen
- * Hydrolyzes fibrin directly
- * Reduces platelet aggregation
- * Lowers whole blood viscosity
- * Decreases C-RP & ESR
